Statistics: Mean 33.376; Variance 170.298; scale 0.196

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         55558
                                                                                                                                                                     PT DNA encoding proteins which can be incorporated with wild type mincleocapsid subunit(s) into a viral nucleocapsid - useful for inhibition of viral replication, especially hepatitis B virus PS Claim 15; Page 35; 60pp; English.

CC This polypeptide comprises the hepatitis B virus (HBV) 25 kDa (p25) protein that is encoded by the full-length HBV precore gene. Evidence is provided that HBV replication is inhibited in the presence of high levels of HBV precore or precore-related proteins. These proteins can be incorporated into HBV nucleocapsids along thin the p21 core protein (see W50251), which is the usual nucleocapsid component, and thereby render the nucleocapsids deficient in encapsidating HBV pregenomic RNA. Thus, overexpression of the precore proteins, or certain variants of them, cappression of the precore proteins, or certain variants of them, cappression of the precore proteins of HBV replication. Suitable cappression of the precore proteins of HBV pregenomic RNA. Thus, overexpression of the precore proteins of HBV pregenomic RNA. Thus, overexpression of the precore proteins of HBV pregenomic RNA. Thus, overexpression of the precore proteins of HBV pregenomic RNA. Thus, overexpression of them, suitable of the precore proteins of HBV pregenomic RNA. Thus, overexpression of them, suitable of the precore proteins of the precore by them, suitable of the precore proteins of the precore by them, suitable of the precore proteins of the precore proteins of the precore by them, suitable of the precore proteins of the

Alternatively, a nucleic acid construct that directs overexpression of an inhibitory protein in target cells is used for the gene therapy of HBV infection.

                                                                                             PT Vaccinating against viral infections such as rables, hepatitis B, PT HIV, HSV, EBV, CMV, numps etc.

PS Disclosure; Fig 13; 456pp; English.

CC The sequence given is encoded by an expression cassette which comprises a portion of the hepatitis B virus (HBV) pre-S region (S12/CC core) which is precisely linked to the IJL promoter derived from CC core, which is precisely linked to the HBL promoter derived from CC vaccinia virus. This DNA sequence was linked to the S1 and S2 countries and this fragment was used in the construction of a NYVAC sequences and this fragment was used in the construction of a NYVAC in the construction. These were HBV m protein (small pre-S antigen, SpsAg) and HBV L (large pre-S antigen, 198Ag). Each of these gene containing essential genes. NYVAC is separated by from each other by large regions of vaccinia DNA containing essential genes. NYVAC is deletion of six non-essential regions of the genome encoding known or potential virulence factors. The deletion to impress the spacing of the three inserted sequences ensured that any recombination that did occur would lead to disruption of the construction of the construction and would cause unviable vaccinia virus. Plasmid phBv DN AA carries an insert (T49598) coding for a prot (W09048) comprising a hepatitis B virus (HBV) core protein (see also W09044) fused in-frame at amino acid 179 with the HBV suri protein (see also W09045) at amino acid 8. Plasmid phBv DN BB (T49599) expresses the HBV core fused at amino acid 175 to the surface protein at amino acid 112 (W09049). phBv DN AA was at least as potent an inhibitor of HBV replication as construct pHBV DN (T49597); phBV DN BB was less inhibitory than pHBV DN. Vectors expressing hepadnavirus dominant negative core mutants be utilised in the gene therapy of viral infections.

PPT New conjugates and fusion proteins of immunogenic polypeptide -

PPT and hepatitis B core antigen, useful in vaccines.

PPT and hepatitis B core antigen, useful in vaccines.

PS Disclosure; p; English.

CC This sequence contains the T cell stimulating epitopes, amino acid

CT This sequence contains the T cell stimulating epitopes, amino acid

CT This sequence contain determinants that suppress T cell activation.

PS Disclosure; p; English.

CC This sequence sesentially consisting of 15 to 55 amino acids

CC TO-140 do not contain determinants that suppress T cell activation.

CC Polypeptides essentially consisting of 15 to 55 amino acids

CC corresponding to the above mentioned HBV regions are T cell

CC stimulating. Coupling a polypeptide immunogen to such sequences,

CC e.g. by using a bifunctional reagent which forms a disulphide link,

CC improves its immunogenicity. These are useful in vaccines and can be us

CC therapeutically to improve T cell response to HBCAg in infected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                subjects.

CC This is the 21 kDa (p21) protein of hepatitis B virus (HBV) that CC assembled into a 180 kSa subunit nucleocapsid structure that CC promotes viral replication. Evidence is provided that HBV replication is inhibited in the presence of high levels of HBV CC precore or precore-related proteins. These proteins can be incorporated into HBV nucleocapsids along with the p21 core protein and thereby render the nucleocapsids along with the p21 core protein core protein variants of them, leads to transdominant inhibition of HBV CC pregenomic RNA. Thus, over-expression of the precore proteins or CC certain variants of them, leads to transdominant inhibition of HBV CC wettors and host cells, and can be provided expension can be produced by recombinant methods using claimed expression collect acid construct that directs overexpression of an inhibitory protein in target cells is used for the gene therapy of HBV creation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       protein that is produced by elimination of the 19-amino acid leader peptide from the 25 kDa full-length HBV precore protein (see W50250). Evidence is provided that HBV replication is inhibited in the presence of high levels of HBV precore or precore-related proteins. These proteins can be incorporated into HBV nucleocapsids along with the p21 core protein (see W50251), which is the usual nucleocapsid to component, and thereby render the nucleocapsids deficient in encapsidating HBV pregenomic RNA. Thus, over-expression of the precore proteins, or certain variants of them, cleads to transdominant inhibition of HBV replication. Suitable inhibitory proteins include p25 (see W50250), p22, Met-p22 (see w50242), p18 (see W50236), Met-p18 (see W50237) and Met-p18-Het (see W50238). Heterologous peptides (see W50237) and Met-p18-Het (see W50238). Heterologous peptides (see W50237) and peptides (see W50238). Heterologous peptides (see W50237) and met-p18 proteins can be produced by recombinant methods using claimed expression vectors and host cells. They can be provided exogenously to the target cells for use in inhibiting HBV replication.

Can Alternatively, a nucleic acid construct that directs overexpression of any inhibitory protein in target cells is used for the gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

Claim 5; Page 55-56; 83pp; English.

Alteration of the C-terminus of the core protein (W09044) of Alteration of the C-terminus of the core protein of the wild-type virus polypeptide capable of reducing replication of the wild-type virus by a dominant negative mechanism. The inhibitory effect is species-specific and is achieved by deletion of a few C-terminal amino acids from the core protein, and/or by joining the core protein to a hepadnavirus surface protein (see also W09045), protein to a hepadnavirus surface fusion. Such mutant polypeptides (see

                                                                                                                                                                      Recombinant DNA coding for polypeptide - have specificity of hepatitis B viral antigens in detection or antibody stimulation Example; Figs 3-4; 43pp; English. Human serum from a single HBsAg positive, HBeAg positive donor (serotype adym) was used to prep. a DNA-contg, pellet which was labelled with 3H or 3P as described by Raplan et al (1973). The labelled DNA was then extracted with phenol from the resulting pellet using the procedure of L. I. Lutwick and W. S. Robinson (1977). It was then cloned in plasmid pBR322 which was used to transform E. coli. Micro-organisms prepd. by the processes are deposited at the NCIB as pBR322-HBV-G-L, e.g. E. coli HB101/pBR322-Pst I dG:

CC Human serum from a single HBSAq positive, HBeAq positive donor CC (serotype adym) was used to prep. a DNA-contg. pellet which was CC labelled with 3H or 32p as described by P. M. Kaplan et al (1973).

CC The labelled DNA was then extracted with phenol from the resulting pellet using the procedure of L. I. Lutwick and W. S. Robinson (1977).

CC It was then cloned in plasmid pBR322 which was used to transform E.

CC coli. Micro-organisms prepd. by the processes are deposited at the CNCIB as pBR322-HBV-G-L, e.g. E. coli HB101/pBR322-PSt I dG:

Disclosure; Fig 7; 12pp; Japanese.
The hepatitis B core gene is recombined with pv-1 DNA
and IL-1 beta to form a plasmid (047738) which is then used to
a vaccine. NB: Sequence is difficult to read in the original
specification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA used in prevention of infections by hepatitis virus B - comprises structural gene of hepatitis virus adr B surface antigen coding gene and at least 1 virus core antigen structural gene. Disclosure; Fig 3: 13pp; Japanese.

The sequence is that of hepatitis virus core antigen (HBcAg). It can be used as a vaccine for the prevention of infections by hepatitis B virus (HBV) and also in the diagnosis of early stages of HBV infection. See also P40310.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 27-APR-1984,

                                                                                                                                                                                                                                                                                          Recombinant plasmid for high immunogenity virus - contains recombined haemagglutinin gene, hepatitis B core gene of vaccinia virus and exotic genes Disclosure; Fig 6; 12pp; Japanese.

The hepatitis B core gene is recombined with pv-1 DNA and IL-1 beta to form a plasmid (047738) which is then used to proactine. NB: Sequence is difficult to read in the original
                                                                                                                                                                                                                                                                  specification.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Tabular output not generated. Run on: Thu Dec 16 12:48:53 1999; MasPar time 12.80 Seconds 874.642 Million cell updates/sec

Scoring table:

Title:

Description: Perfect Score: Sequence: >US38183-1-38183 (1-396) from us38183-1-38183.pep 2977 1 MDIDPYKEFGATVELLSFLP......RRRRSQSPRRRRSQSRESQC 396

РАМ 150 Gap 11

Searched:

Post-processing: Minimum Match 0% Listing first 45 summaries

77977 seqs, 28268293 residues

Database: swiss-prot37 1:swissprot

Statistics: Mean 48.173; Variance 102.286; scale 0.471

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
